Main projects:

MERN eCommerce Shop Oct'21- Nov'21

- I built a completely customized eCommerce / shopping cart application from scratch with the MERN stack. Backend (Node.js): DB store at Mongo DB Compass and Atlas. Client-side was written in React-js framework, using React-Redux for global state includes actions, reducers and store. Designed with the help of Bootswatch's, Font-Awesome's and React-Bootstrap's services.
- My site allows you to register (password will be encrypted), add your favorite products to your cart, place order with Paypal payment method and write a customer review after your shipping complete.

Cinema Site Jul' 21- Aug'21

- Cinema management site for employees.
- The site exposed different functionalities to different employees permissions, like creating users, listing/adding/deleting/editing movies and subscriptions for customers.
- Created two separate web services to handle the different logics of the system, one for managing the employees and their permissions and one for managing the customers and their subscriptions and movies they go to.
- The Client-side talks only with the cinema employees server to handle and manage permissions to each employee's actions on the subscriptions server.
- Each server communicates with a different MongoDB instance and implements the server logics using controllers, business logics, and models(mongo schemas) to any collection.
- The employees server is using JSON files to manage the employees permissions.
- Used axios in various APIs to communicate with the 3rd party API for setting up the starting state of the DB.
- The Client-side is a SPA written in React framework with context- API state management.
